

Mac-A-Mal

An Automated Framework for Mac Malware Hunting

Pham Duy Phuc[†]
Fabio Massacci ‡‡

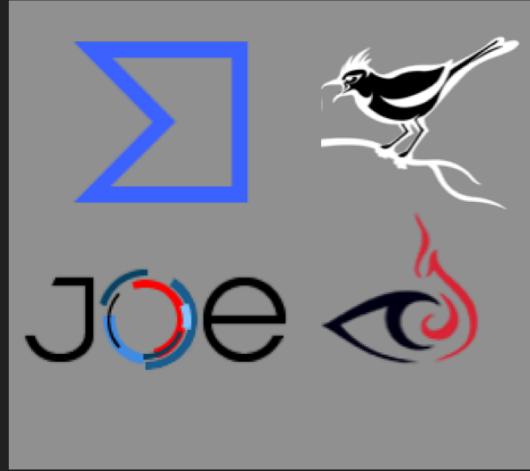

*Sfylab[†]
University of Trento[‡]*

Motivation

- Mac OS market share is increasing 🔥
- Increasing number of new Mac malware
- Increasing complexity of Mac threats
- Common techniques to analyze malware using sandbox technologies on Windows, Linux, Android, ~~macOS~~.
→ Develop a auto malware analysis framework on macOS.

Malware analysis for macOS

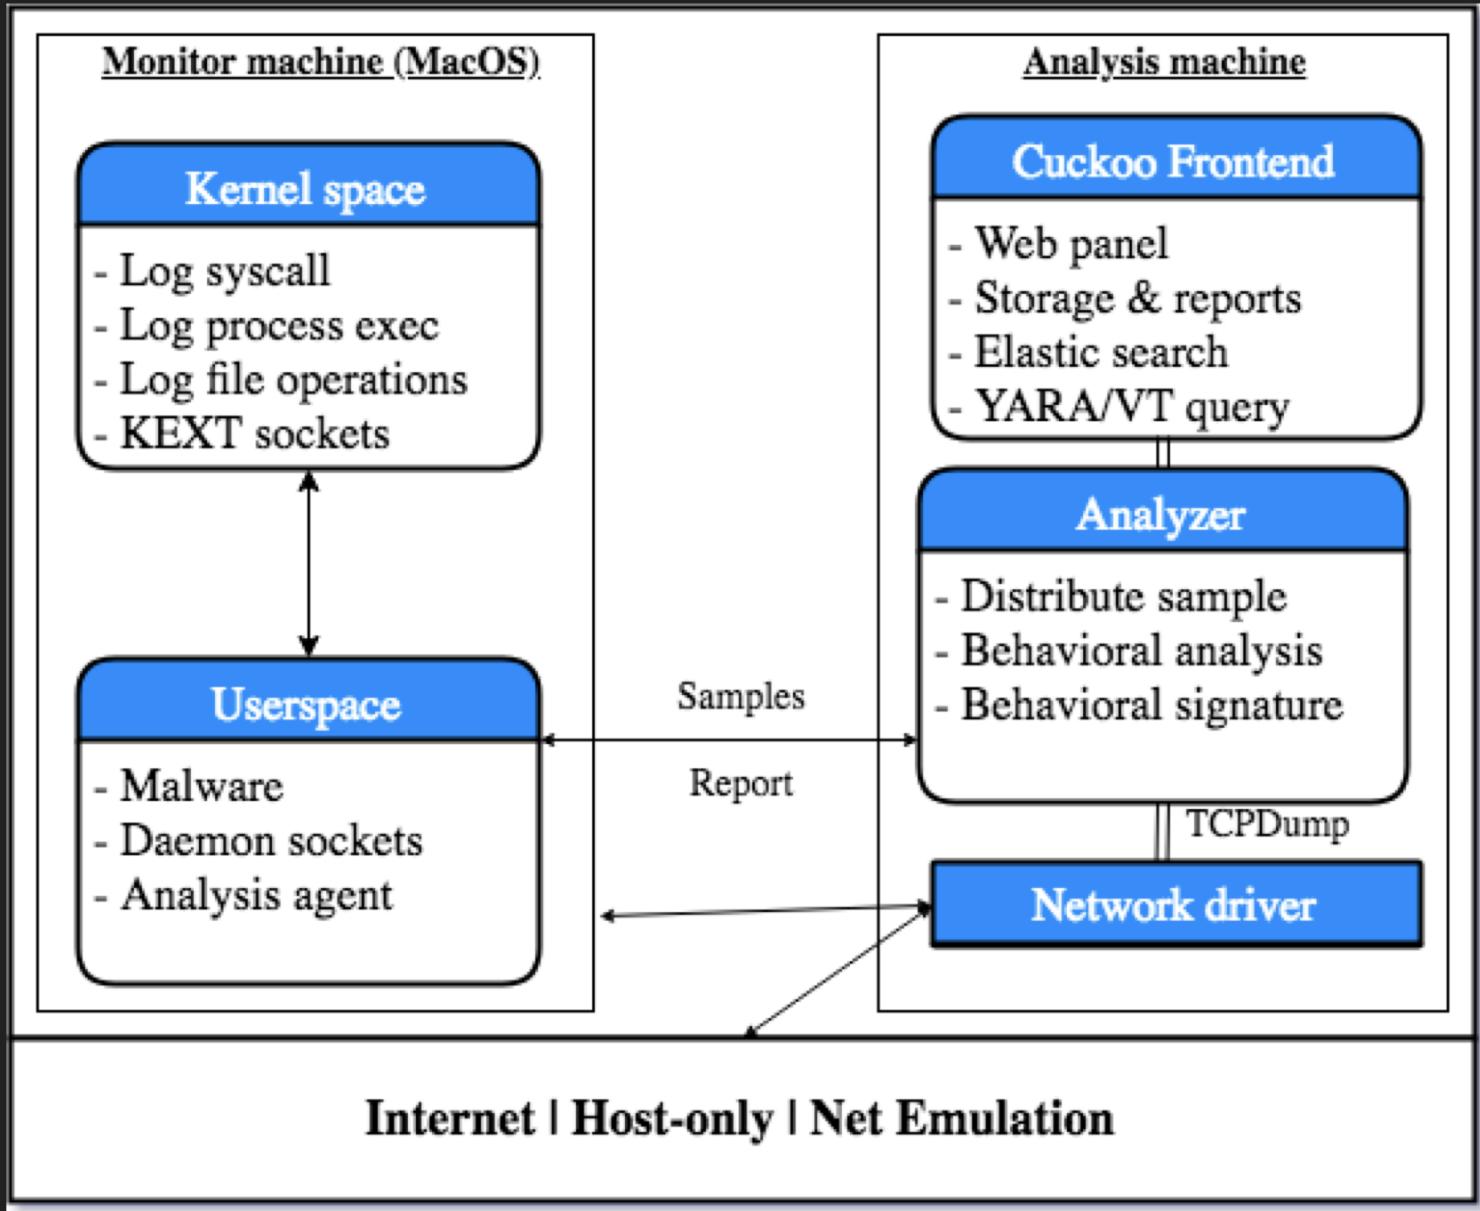

- Static analysis
- Dynamic analysis
- Meet Cuckoo!

Mac-A-Mal static analysis

- Binary information: Header; CODE, DATA segments; DYLIB; LOAD commands; Symbol table.
- Entropy
- Signature information
- BoM information for DMG/APP archive
- Plist information

Mac-A-Mal dynamic analysis

Any file types are supported

- /usr/bin/open - mac_syscall interface
- hdiutil – mount Apple disk image
- Java – Perl – Python
- Archive
- URL

Kernel-space monitor

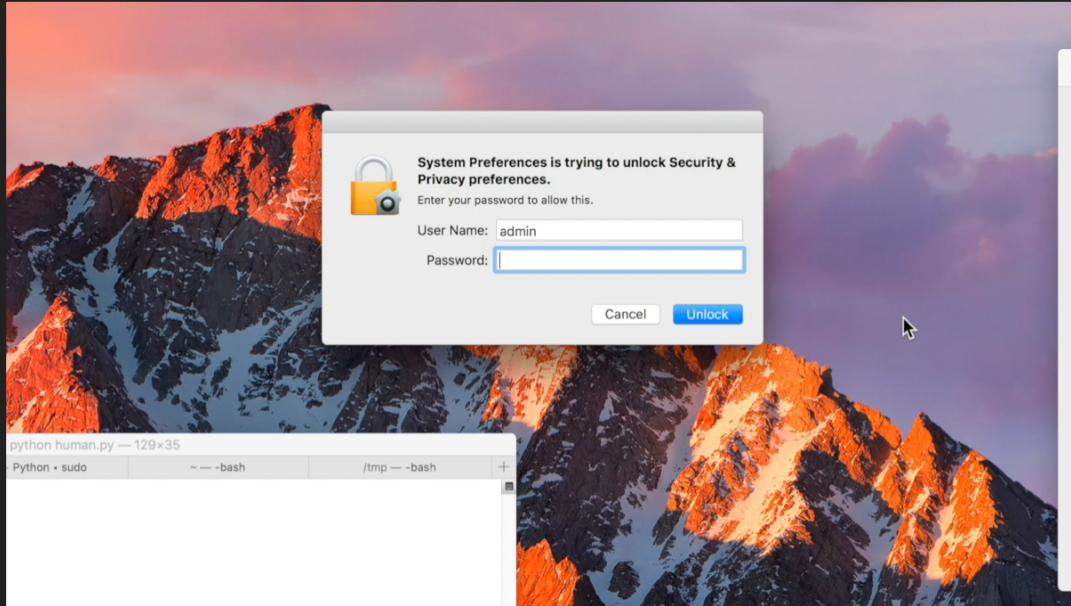

- Resolve macOS kernel protection: Onyx the black cat & Grey-fox
- Syscall interception and arguments collection
- Process tracing, XPC Services tracing
- File accessed behaviors
- Network syscall

Detect evasion techniques & mitigation

- Detect Anti-debug:
 - By intercept → ptrace(), sysctl()
- Mitigate Anti-sandbox:
 - SIP status manipulation → csrctl ()
 - Hardening process names, virtual devices information (display resolution, processor cores, etc.) → sysctl(), ioctl()
 - Harden VM configuration (e.g: CPUID, VM Plist)

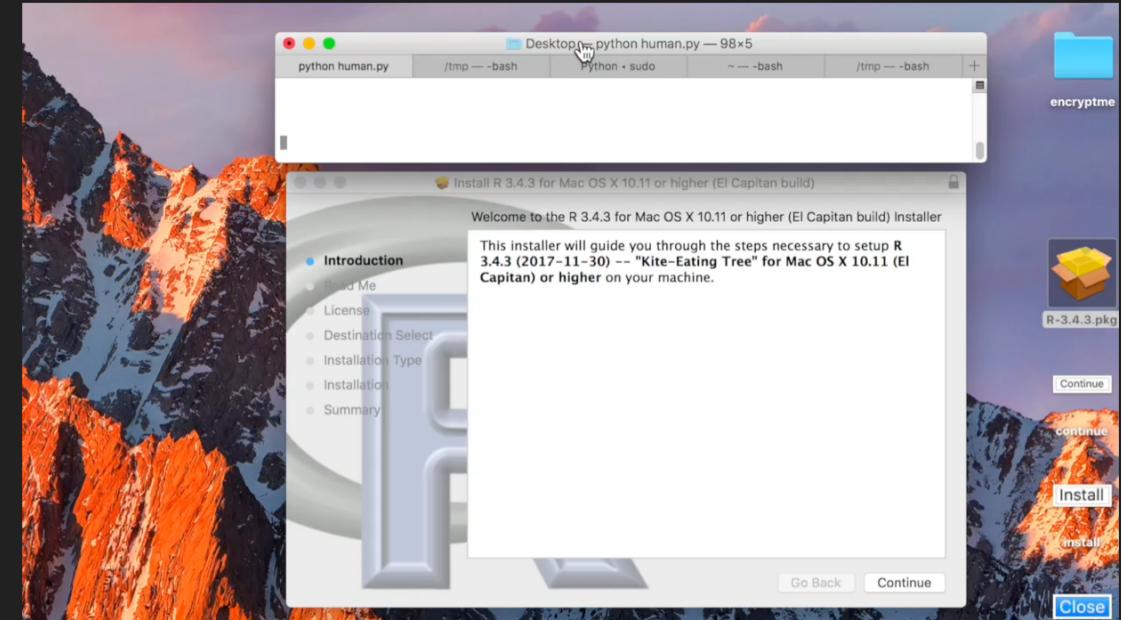

March 12, 1970, 1:16 p.m. posix_spawn ⊕	arg0: 5441 arg1: /usr/sbin/sysctl arg2: -n hw.model
March 12, 1970, 1:16 p.m. posix_spawn ⊕	arg0: 5442 arg1: /usr/sbin/sysctl arg2: -n hw.physicalcpu

(no) Human Interaction

Authorization Solver

- Quartz:
CGEventCreateKeyboardEvent

Screenshots & Interact MessageBox:

- Quartz:
CGWindowListCreateImage,
CGEventCreateMouseEvent

OSX/Mughthesec

install.searchwebsvc.com
trustedsafe finder.com

What makes the campaign interesting?

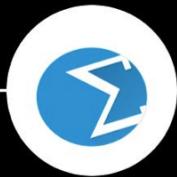

#1

Fake Adobe Flash install
Free bonus:
- Advanced Mac cleaner
- Safe search Safari Extension
- Booking.com

#2

8 Vietnamese valid Apple developer ID (only 2 revoked)
~\$800

#3

97% undetected on Virustotal (over 71 found samples)

#4

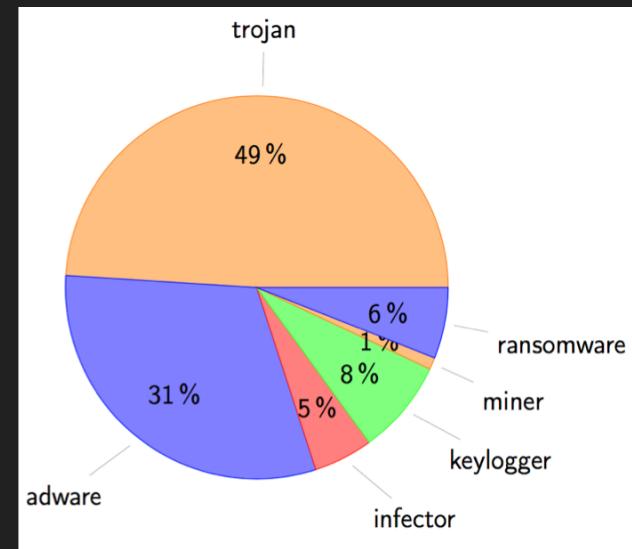

Staying undetected at least 4 months.
>10 domains participated.
Drive-by CDN hosting

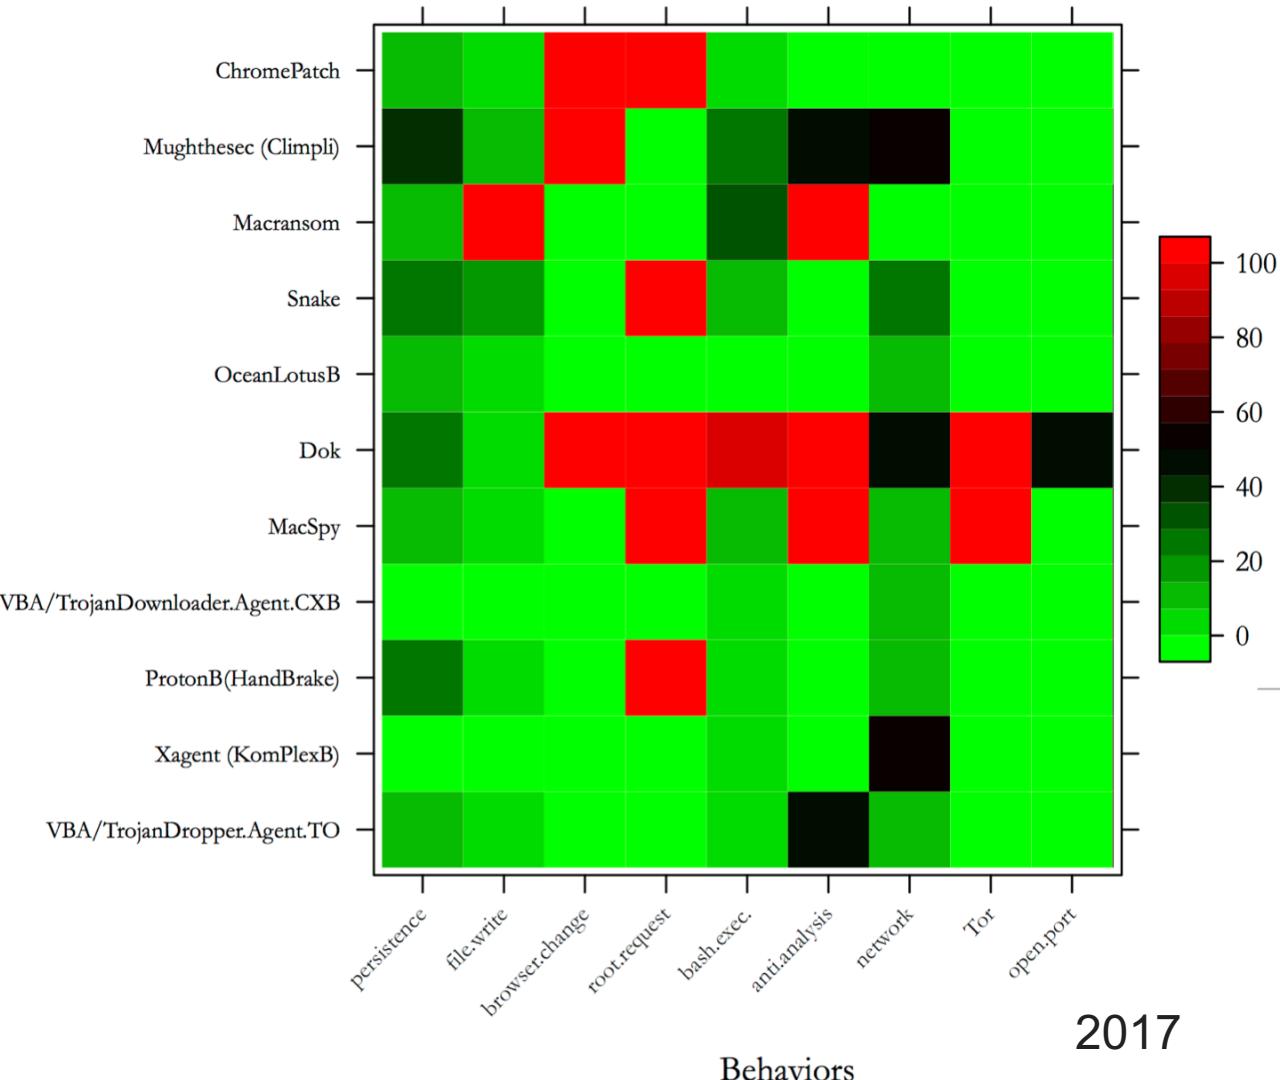

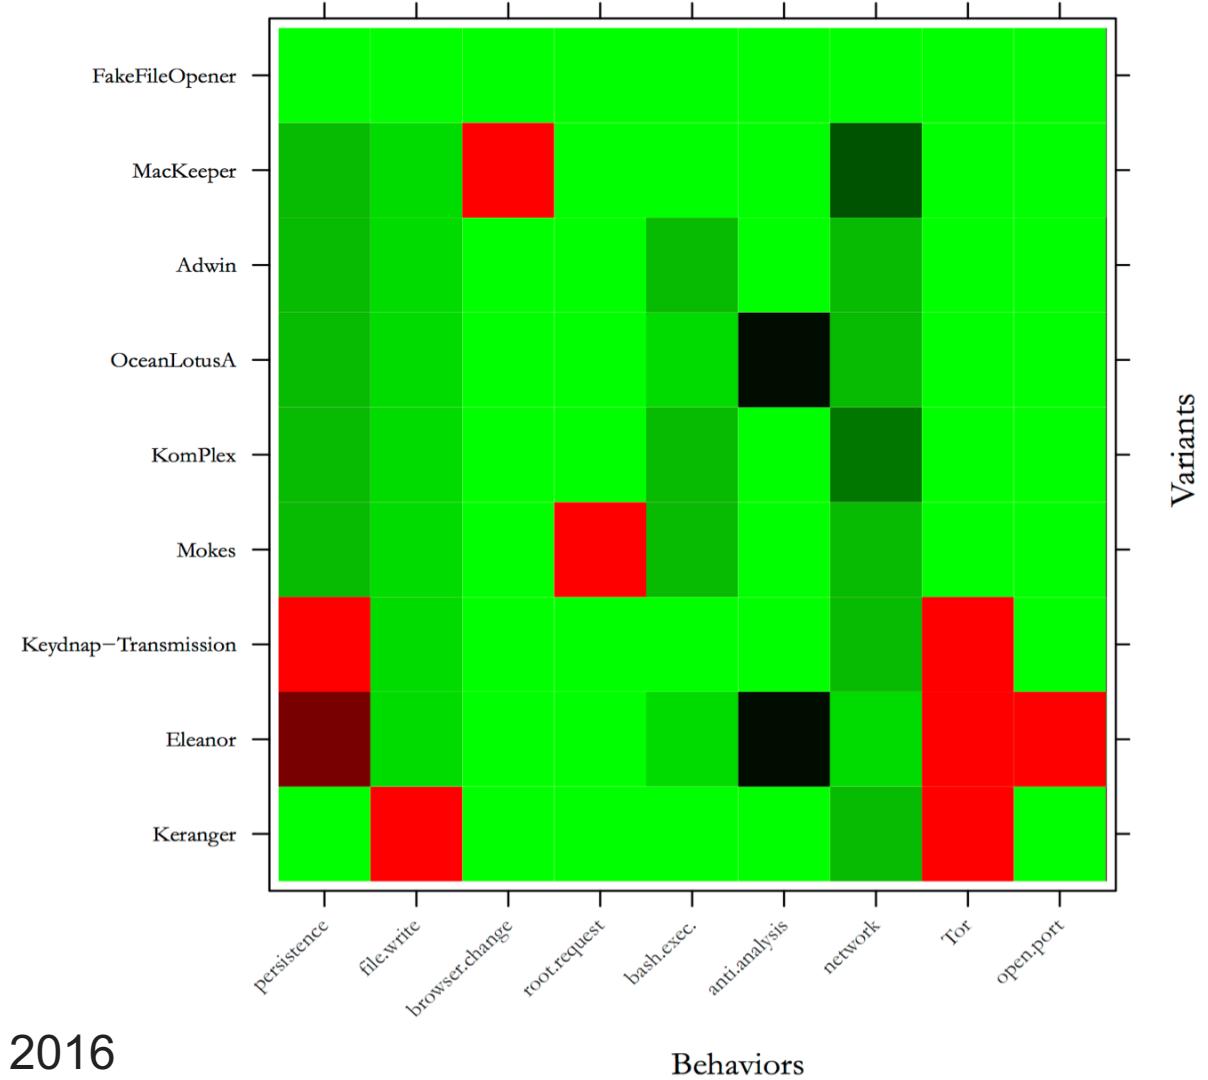

Screenshot(s)

On large scale

- N=2149
- 85% of the collected samples are adware, which dominated by OSX/Pirrit and OSX/MacKeeper
- 86 different Mac malware families, and 49% of them belongs to backdoor/trojan.

macOS malware evolution

Summary

- It is possible to automatically analyze network traffic, malware evasion techniques, persistence methods, file operations etc. from samples in virtualized Mac environment.
- We succeeded in clarifying malware variants and its evolution on macOS
- Found undiscovered Mac adware including legitimate Apple developer certificates, other undetected backdoor (APT32) → possibility of outperforming existing solutions currently available on the market.
- Opensource: <https://github.com/phdphuc/mac-a-mal>

Q&A
